# PropStop™ Detects Doors Propped Open

StaffAlerter Dashboard provides real time status of all doors in your facility

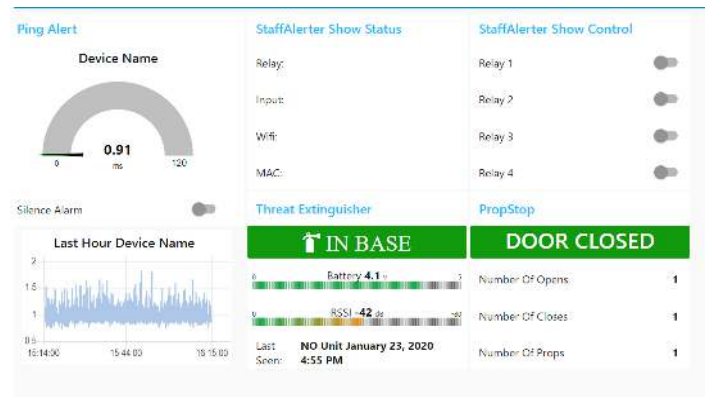

PropStop is a Wi-Fi connected, battery powered device that mounts to any door. Information on the door position is sent to the StaffAlerter Dashboard for status. A time value is set to determine what period a door is left open before the system determines a propped open condition exists.

PropStop utilizes the StaffAlerter Cloud to notify users of conditions like door propping via SMS, Calls or Email.

Additional actions that can be executed include overhead pages, activation of StaffAlerter relays to activate other signals and systems as required.

Door propping is a significant breach of a facility security plan. StaffAlerter PropStop detects this threat and reports. Know what's happening in your location.

Utilizing the StaffAlerter platform, a facility can monitor and control any device or system from a central cloud-based solution. For more information or a demonstration, contact sales@pmpowerproducts.com.
